**Predictive Services Discussion:** Well above average temperatures are expected to continue across the northern half of the West, but temperatures will be lower than previous days west of the Cascades. Maximum temperatures of 90-110°F in the valleys and mountain locations in the upper 80s to low 100s with minimum RH of 5-20% are forecast. Plume-dominated fire behavior on active large wildfires remain possible in the Sierra, northern California, along and east of the Cascades, and into portions of Idaho, southwest Montana, and Wyoming. Gusty Cascade gap winds and dry and breezy conditions in portions of southern Idaho and northwest Montana are also likely. Isolated mixed wet and dry thunderstorms are likely in the Sierra into far northern California, southern Oregon, and across portions of central and northern Nevada. Widespread smoke will continue across northern California, the Pacific Northwest, the northern Great Basin, and the Northern Rockies. Monsoonal thunderstorms will develop across much of the Southwest and into the southern and eastern Great Basin and Colorado Rockies. Tropical Depression Fred will likely strengthen back to a tropical storm and move through the Florida Keys, while bringing heavy rain to South Florida and portions of the Florida Gulf Coast.

## Wildland Urban Interface – Structure Protection

*Operational Engagement Category*

The primary consideration of any operation is to assure firefighter and public safety. It is a must to assess potential fire behavior, ingress/egress routes, nature of the threat, hazardous materials, and available water supplies before engaging in the protection of any structure.

### **Factors that may make an attempt to save a structure too dangerous include:**

- The fire is making a sustained run and there is little or no clearance between the structure and the fuel.
- The fire behavior is extreme; spot fires are numerous and the spread is outpacing containment.
- Water supply will not last as long as the threat of the fire.
- The fire intensity dictates that you leave the fire area immediately.
- The structure is constructed of wood and has a wood shake roof.
- The roof of the structure is more than one-quarter involved.
- There is fire inside of the structure, or windows are broken and there is no way to quickly repair them.
- You cannot safely remain at the structure because your escape route could become unusable.

### **When implementing a plan to protect structures, consider the following:**

- Do not enter a burning structure unless you are trained, equipped, and authorized. Firefighter safety and survival is the number one priority.
- Always stay mobile and wear all personal protective equipment (PPE).
- Back in equipment to allow for a quick escape.
- Coil a short, charged line with a fog nozzle on your engine for safety and quick knockdown capability.
- Don't make long hose lays.
- Reserve at least 100 gallons of water in your tank.
- Check the road system before the fire approaches. Know bridge limits, alternate access routes, and turnarounds for your vehicle and other support vehicles.
- Determine if residents are home. Leave the inside and outside lights on, regardless of the time of day. Close the garage door.
- Place the owners' ladder at a corner of the home on the side with the least fire threat.
- Coil and charge garden hoses.
- Check and mark hazardous materials (e.g., Liquefied Propane Gas [LPG] tanks, pesticides, and paint storage).
